                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            exclude production of delta-8-unsaturated bases, to increase tolerance or resistance to soil salinity, ion stress or toxicity, drought, wet conditions, cold or frost and/or phytopathogenic microorganisms, or to alter size growth and flowering time. Cells, transgenic organisms or plants containing the DNA sequence can be used to produce sphingolipids and capnoids with unsaturated sphingobases. The sphingolipids or capnoids can be used in cosmetics, pharmaceuticals and foods and as chemical raw materials. AAY51335-Y51344 represent sphingolipid desaturase protein fragments described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel sphingolipid desaturase that selectively introduces a double bond into the sphingobase of the ceramid residue of sphingolipids and capnoids. A DNA sequence encoding the sphingolipid desaturase, or a vector containing the DNA sequence, can be used to produce transgenic plants, especially crop plants, with an increased or decreased delta-8-unsaturated long-chain base content or an altered delta-8-unsaturated long-chain base deficiency, to compensate for a delta-8-unsaturated long-chain base deficiency, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antidiabetic; cytostatic; auditory; cholecystokinin-8; CCK-8; neuropathy; peripheral nervous system; diabetes mellitus; cancer treatment; cytostatica; hearing impairment; visual handicap; alcohol-induced neuropathy; dystrophy.

The present sequence is one such peptide. The peptides of the present invention may be used to treat neuropathies in the PNS associated with diabetes mellitus, cancer treatment such as cytostatica, hearing impairment and/or visual handicap, alcohol-induced

The DNA sequence was isolated from a library of clones of S. aureus WCUH 29 in Escherichia coli. The DNA sequence can be used in the construction of ribozymes and antisense sequences to control the expression of Staphylococcal genes. The DNA sequence is also useful as a source of regulatory elements for the control of bacterial gene expression. The present protein may be used to produce vaccines to enable a host to produce specific antibodies with antibacterial action. These vaccines and antibodies would protect a host against invasion by S. aureus, and conditions relating to Staphylococcal infection, short staphylococcal food poisoning, scaled skin syndrome, and toxic

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.

Annisense nucleic acid sequences of these sequences are used to inhibit expression of a gene from Helicobacter species. H. pylori whole genomic DNA was isolated and nebulised to a median size of 2000 bp. Purified DNA fragments were blunt-ended and ligated to unique BstXI-linker adapters in 100-1000 fold molar excess. These linkers are complementary to the BstXI-cut pMPX vectors, while the overhang is not self-complementary. Therefore the linkers will not concatemerise nor will the cut vector re-ligate itself easily. The linker-adapter inserts were ligated to each of the 20 pMPX vectors to construct a series of shotgun subclone libraries. The purified DNA samples were then
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence is a H. pylori secreted or periplasmic protein. Helicobacter pylori has been strongly linked to chronic gastritis and duodenal ulcer disease. The nucleid sequences of the invention are used to evaluate compounds, especially activators or inhibitors of bacterial life cycle, for the ability to bind an H. pylori nucleic acid sequence. The nucleic acid sequences, and corresponding proteins, are

the proteins are collectively known as colon cancer antigens. The color cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      in the specification (Ser/Asp-Asn218).

The mutant subtilisin does not lose activity as rapidly when stored in soln. with detergents or when subjected to high heat during use in cleaning. It is used for the removal of proteinaceous stains or fabric. Other stabilising mutants may be introduced into the fabric.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NB: to construct sequences AAR10204-13, the B. subtilis wild-type sequence was retrieved from the GENESEQ database (AAP90095; J0113 and amino acid residues altered according to the mutations described and amino acid residues altered according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutations described according to the mutation according to the mutation according to the mutation according to the mutation according to the mutation according to the mutation according to the mutation according to the mutation according to the mutation according to the mutation according to the mutation according to the mutation according to the mutation according to the mutation according to the mutation according to the mutation according to the mutation according to the mutation according to

Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204

                                                                                         This sequence is derived from the nucleotide sequence encoding the light chain variable region. The "x" residues represent nonsense codons. The coding sequence has been translated in all 3 reading frames (see also AAR12130 and AAR12131). The L'V region is duplicated in so-called "aberrant" light chains (see AAQ11878), conferring

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAW84298
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                           The present sequence represents a consensus sequence of glial cell-line derived neurotrophic factor receptor (GDNFR) protein and GDNFR-related (GRR) proteins GRR and GRR3. The proteins have similar functions. GDNFR proteins are functionally characterised by the ability to bind glial cell line-derived neurotrophic factor (GDNF) and/or neurturin specifically, and to act as part of a molecular complex which mediates or enhances the signal transduction affects of GDNF and/or neurturin. The proteins can be used for treating improperly functioning dopaminergic nerve cells, Parkinson's disease, Alzheimer's disease or amyotrophic lateral sclerosis. They can also be used for treating neurological disorders associated with diabetes, glaucoma or other diseases and conditions involving retinal ganglion cell degeneration of sensory neuropathy caused by injury to, insults to, or degeneration of sensory neurons, pathological conditions, or disease or injury-related neuropathy caused by a conditions or disease or injury-related neuropathy caused for description derived for description of the conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CDNFR; glial cell line-derived neurotrophic factor; GDNF; neurturn; signal transduction; dopaminorgic nerve cell; Parkinson's disease; Alzheimer's disease; amyotrophic lateral sclerosis; neurological disorder; diabetes; glaucoma; sensory neuron; retinal ganglion cell degeneration; sensory neuropathy;

                                                                The present sequence represents a consensus sequence of rat and human glial cell-line derived neurotrophic factor receptor (GDNFR) protein and GDNFR-related (GRR) proteins. The proteins have similar functions. GDNFR proteins are functionally characterised by the ability to bind glial cell line-derived neurotrophic factor (GDNF) and/or neurturin specifically, and to act as part of a molecular complex which mediates or enhances the signal transduction affects of GDNF and/or neurturin. The proteins can be used for treating improperly functioning dopaminergic nerve cells, parkinson's disease, Alzheimer's disease or amyotrophic lateral sclerosis. They can also be used for treating neurological disorders associated with diabetes, glaucoma or other diseases and conditions involving retinal ganglion cell degeneration, as the processis of the conditions of the conditions of the conditions of the conditions involving retinal ganglion cell degeneration, as the conditions of the conditions involving retinal ganglion cell degeneration.
                                                                                                                                                                                                                                                                                                                                                             New isolated glial cell line-derived neurotrophic factor receptors used to develop products for treating e.g. improperly functioning dopaminergic nerve cells, Parkinson's disease, Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GDNFR; glial cell line-derived neurotrophic factor; GDNF; neurturin; signal transduction; dopaminergic nerve cell; Parkinson's disease; Alzheimer's disease; amyotrophic lateral neurological disorder; diabetes; glaucoma; sensory neuron; retinal ganglion cell degeneration; sensory neuropathy;

                                   The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM3642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilication of the activities with a second and transcript of the activities.
utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening,

Cyclodextrins (CD) are cyclic glucose oligomers with a CC hydrophobic internal cavity that form inclusion complexes with many CC small hydrophobic molecules. These CGTase mutants have a modified CC substrate binding and/or product selectivity, compared to this sequence. The mutants are created using primer mutagenesis to modify the gene cencoding this sequence. These sequences have greater product selectivity and/or reduced product inhibition (better yields) than wild-type CGTase. CC These mutant sequences are used to manufacture the 6 main CD types (comprising 6-11 glucose units), or linear 2-12 glucose oligosaccharides, optionally in situ, e.g. during production of baked goods, to stabilise cohemicals during their manufacture and in detergents. CD are known for CC their usefulness in foods, e.g. as a bread-improving agent, to cohesterol (e.g. in egg yolk or butter), in plastic laminates, films cohesterol (e.g. in egg yolk or butter), in plastic laminates, films cohesterol (e.g. in egg yolk or butter), in plastic laminates, films cohesterol (e.g. in egg yolk or butter).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                Lys
   AAW17568-W17579, and AAW17592-W17605 represent mutant versions of the cyclomaltodextrin glucanotransferase (CGTase) of Bacillus circulans strain 251 (see AAW06773 for wild type sequence). CGTase catalyses the conversion of starch and similar substrates into cyclomaltodextrins (also known as cyclodextrins) via an intramolecular transglycosylation reaction. Cyclodextrins (CD) are cyclic glucose oligomers with a hydrophobic internal cavity that form inclusion complexes with many small hydrophobic molecules. These CGTase mutants have a modified substrate binding and/or product selectivity, compared to this sequence. The mutants are created using primer mutagenesis to modify the gene
                                                                                                                                      or linear
                                                                                                         Claim 40;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              These mutant sequences are used to manufacture the 6 main CD types (comprising 6-11 glucose units), or linear 2-12 glucose oligosaccharides, optionally in situ, e.g. during production of baked goods, to stabilise chemicals during their manufacture and in detergents. CD are known for their usefulness in foods, e.g. as a bread-improving agent, to encapsulate/stabilise/solubilise vitamins, dyes, pharmaceuticals, pesticides or fungicides, to bind/remove lipophilic compounds such as cholesterol (e.g. in egg yolk or butter), in plastic laminates, films otc. and to make biodegradable plastics.
                                                                                                                                                                                                                                                                                                         thermoanaerobacter; starch; cyclomaltodextrin; cyclodextrin; pesticide; transglycosylation; cyclic glucose oligomer; glucose oligosaccharide; cholesterol removal; food stabiliser; vitamin stabiliser; fungicide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             encoding this sequence. These sequences have greater product selectivity and/or reduced product inhibition (better yields) than wild-type CGTase.

CD are known for their usefulness in foods, e.g. as a broad-improving agent, to encapsulate/stabilise/solubilise vitamins, dyes, pharmaceuticals, pesticides or fungicides, to bind/remove lipophilic compounds such as cholesterol (e.g. in egg yolk or butter), in plastic laminates, films
                                                                                                                                                                                                                     The mutants are created using primer mutagenesis to modify the gene encoding this sequence. These sequences have greater product selectivity and/or reduced product inhibition (better yields) than wild-type CGTase. These mutant sequences are used to manufacture the 6 main CD types (comprising 6-11 glucose units), or linear 2-12 glucose oligosaccharides, optionally in situ, e.g. during production of baked goods, to stabilise
                                                                                                                                                                                                                                                                                                                                                        AAW17568-W17579, and AAW17592-W17605 represent mutant versions of the cyclomaltodextrin glucanotransferase (CGTase) of Bacillus circulans strain 251 (see AAW06773 for wild type sequence). CGTase catalyses the conversion of starch and similar substrates into cyclomaltodextrins (also known as cyclodextrins) via an intranolecular transglycosylation
                                                                                                                                                                                                                                                                                                      reaction. Cyclodextrins (CD) are cyclic glucose oligomers with a hydrophobic internal cavity that form inclusion complexes with many small hydrophobic molecules. These CGTase mutants have a modified substrate binding and/or product selectivity, compared to this sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New variants of cyclo:malto:dextrin glucanotransferase (CGTase) - have altered substrate binding, useful for prodn. of cyclodextrin(s) or linear oligosaccharide(s), opt. formed in situ in e.g. baked
                                                                                                           Sequence

17-OCT-1995;
                                These mutant sequences are used to manufacture the 6 main CD types (comprising 6-11 glucose units), or linear 2-12 glucose oligosaccharides, optionally in situ, e.g. during production of baked goods, to stabilise chemicals during their manufacture and in detergents. CD are known for their usefulness in foods, e.g. as a bread-improving agent, to encapsulate/stabilise/solubilise vitamins, dyes, pharmaceuticals, pesticides or fungicides, to bind/remove lipophilic compounds such as cholesterol (e.g. in egg yolk or butter), in plastic laminates, films etc. and to make biodegradable plastics.
                                                                                                                                                                                                                        (also known as cyclodextrins) via an intramolecular transglycosylation reaction. Cyclodextrins (CD) are cyclic glucose oligomers with a hydrophobic internal cavity that form inclusion complexes with many small hydrophobic molecules. These CGTase mutants have a modified substrate binding and/or product selectivity, compared to this sequence. The mutants are created using primer mutagenesis to modify the gene encoding this sequence. These sequences have greater product selectivity and/or reduced product inhibition (better yields) than wild-type CGTase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New variants of cyclo:malto:dextrin glucanotransferase (CGTase) - have altered substrate binding, useful for prodn. of cyclodextrin(s) or linear oligosaccharide(s), opt. formed in situ in e.g. baked
                                                                                                                                                                                                                                                                                                                                                                                             strain 251 (see AAW06773 for wild type sequence). CGTase catalyses the conversion of starch and similar substrates into cyclomaltodextrins
                                                                                                                                                                                                                                                                                                                                                                                                                                       AAW17568-W17579, and AAW17592-W17605 represent mutant versions of the cyclomaltodextrin glucanotransferase (CGTase) of Bacillus circulans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim

These CGTase mutants have a modified substrate binding and/or product selectivity, compared to this sequence. The mutants are created using primer mutagenesis to modify the gene encoding this sequence. These sequences have greater product selectivity and/or reduced product inhibition (better yields) than wild-type CGTase. These mutant sequences are used to manufacture the 6 main CD types (comprising 6-11 glucose units), or linear 2-12 glucose oligosaccharides, optionally in situ, e.g. during production of baked goods, to stabilise chemicals during their manufacture and in detergents. CD are known for their usefulness in foods, e.g. as a bread-improving agent, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAW17568-W17579, and AAW17592-W17605 represent mutant versions of the cyclomaltodextrin glucanotransferase (CGTase) of Bacillus circulans strain 251 (see AAW06773 for wild type sequence). CGTase catalyses the conversion of starch and similar substrates into cyclomaltodextrins (also known as cyclodextrins) via an intramolecular transglycosylation reaction. Cyclodextrins (CD) are cyclic glucose oligomers with a hydrophobic internal cavity that form inclusion complexes with many

(also known as cyclodextrins) via an intramolecular transplycosylation creaction. Cyclodextrins (CD) are cyclic glucose oligomers with a hydrophobic internal cavity that form inclusion complexes with many small hydrophobic molecules. These CGTase mutants have a modified substrate binding and/or product selectivity, compared to this sequence. The mutants are created using primer mutagenesis to modify the gene encoding this sequence. These sequences have greater product selectivity and/or reduced product inhibition (better yields) than wild-type CGTase. These mutant sequences are used to manufacture the 6 main CD types (comprising 6-11 glucose units), or linear 2-12 glucose oligosaccharides, optionally in situ, e.g. during production of baked goods, to stabilise chemicals during their manufacture and in detergents. CD are known for their usefulness in foods, e.g. as a bread-improving agent, to encapsulate/stabilise/solubilise vitamins, dyes, pharmaceuticals, pesticides or fungicides, to bind/remove lipophilic compounds such as cholesterol (e.g. in egg yolk or butter), in plastic laminates, films cetc. and to make biodegradable plastics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                16-NOV-1995;
